# **About Rollon**

#### **Development of global business**

- 1975 Parent company, Rollon S.r.I., founded in Italy
- **1991** Founding of Rollon GmbH in Germany
- 1995 Expansion of headquarters to new 4,000 m<sup>2</sup> factory Assembly starts in Germany Quality management certified to ISO 9001
- 1998 Rollon B.V. in the Netherlands and Rollon Corporation in the USA are founded Expansion of German branch to new 1,000 m<sup>2</sup> plant
- 1999 Founding of Rollon S.A.R.L. in France Environmental management certified to ISO 14001
- 2000 Rollon s.r.o. founded in Czech Republic
- 2001 Expansion of headquarters to new 12,000 m<sup>2</sup> manufacturing plant
- 2007 Restructuring of the GmbH and alignment of production in Germany to customer-specific adaptations Takeover of the assets of a manufacturer of linear rail systems
- 2008 Expansion of sales network in Eastern Europe and Asia

#### Continual expansion and optimization of the portfolio

Founded in 1975, Rollon manufactured high-precision linear roller bearings for the machine tool industry. Early on, Rollon started manufacturing linear bearings based on the bearing-cage design. In 1979, the Compact Rail self-aligning linear bearings joined the Telescopic Rail industrial drawer slides and Easy Rail linear bearings and became the basis of the strong foundation on which the company is building upon today. Continuing optimization of these core products still remains one of the most important goals at Rollon. The development of the patented Compact Rail linear bearing, which uses different proprietary rail profiles and highprecision radial ball bearing sliders, enables the compensation of height and angle mounting defects in applications, and is only one example of the continuing efforts to innovative the development of our existing product families. In the same manner, we continually introduce innovative new product familiesdisplaying our continuing product development and optimization in the industry. These include:

- 1994 Light Rail full and partial extension telescopic in lightweight design
- 1996 Uniline belt driven linear actuators
- 2001 Ecoline economical aluminum linear actuators
- 2002 X-Rail inexpensive formed steel linear guides
- 2004 Curviline curved monorail profile rail guide with roller carriages
- 2007 Monorail miniature sizes and full sized

Each further innovation of our linear bearings is built upon the our extensive knowledge of the nine product families in production today as well as on the current market demands. Rollon is the ultimate linear technology for any application needs.

# **Product explanation**

# X-Rail: Corrosion resistant or zinc-plated steel linear bearings

X-Rail is the product family of roller embossed guide rails for applications in which an especially economical price/performance ratio and high corrosion resistance are required.

X-Rail consists of three product series: fixed bearing rails, compensating bearing rails and telescopic extension on roller base.

All products are available in stainless steel or zinc-plated steel. There are three different sizes of guide rails. The sliders for the guide rails are available in different versions.

### The most important characteristics:

- Corrosion resistant, FDA/USDA compliant materials
- Compensates for deviations in mounting structure parallelism
- Not sensitive to dirt due to internal tracks
- Wide temperature range of application
- Easy adjustment of sliders on the guide rails

### Preferred areas of application of the X-Rail product family:

- Construction and machine technology (e.g., safety doors, washing bay accessories)
- Medical technology

(e.g., hospital accessories, medical equipment)

- Transport (e.g., rail transport, naval, automotive industry)
- Food and beverage industry (e.g., packaging, food processing)
- Building technology (e.g., blinds)
- Energy technology (e.g., industrial furnaces, boilers)

### Fixed bearings (T-rails)

Fixed bearing rails are used for the main load bearing in radial and axial forces.

### Compensating bearings (U-rails)

Compensating bearing rails are used for load bearing of radial forces and, in combination with fixed bearing rails as support bearings for occurring torques.

### System (T+U-System)

A T and U used together offers compensation for deviations in parallelism and tolerances in the mounting structure.

#### Telescopic drawer slide

Telescopic rails with full extension bridge the gap between cheap drawer slides and heavy-load telescopic rails.

#### Rollers

Concentric and eccentric radial ball bearings made of stainless steel or roller bearing steel are available for each slider. Roller sealing is dependent on the material: 2RS rubber seals or 2Z steel shields. All rollers are lubricated for life.

# **Technical data**

### Performance characteristics:

- Available sizes: 20, 30, 45
- Max. slider operating speeds in the linear bearing rails:
  1.5 m/s (59 in/s) (depending on application)
- Max. telescoping speed: 0.8 m/s (31.5 in/s) (depending on application)
- Max. acceleration: 2 m/s<sup>2</sup> (78 in/s<sup>2</sup>) (depending on application)
- Max. traverse: 3,060 mm (120 in) (depending on size)
- Max. radial load capacity: 1,740 N (per slider)
- Temperature range for stainless steel rails: -30 °C to +100 °C (-22 °F to +212 °F), or steel rails: -30 °C to +120 °C (-22 °F to +248 °F)
- Available rail lengths from 160 mm to 3,120 mm (6.3 in to 122 in) in 80-mm increments (3.15 in)
- Rollers lubricated for life
- Roller seal/shield:
  - CEX... Sliders => 2RS (splashproof seal),
  - CES... Sliders => 2Z (dust cover seal)
- Material: Stainless steel rails TEX... / UEX... 1.4404 (AISI 316L), Steel rails TES... / UES... zinc-plated ISO 2081
- Material rollers: Stainless steel 1.4110 (AISI 440)

### Remarks:

The sliders are equipped with rollers that are in alternating contact with both sides of the raceway. Markings on the body around the outer roller pins indicate the correct arrangement of the rollers to the external load.

Important: Both outside rollers carry the radial load.

- By a simple adjustment of the eccentric roller, the slider has clearance or is set with the desired pre-stress on the rails.
- Sliders of Version 1 (with compact body) come standard with plastic wipers for cleaning the raceways.
- Wipers for sliders of Versions 2 and 3 on request.
- We do not recommend combining (stringing together) the rails.
- Recommended fixing screws according to ISO 7380 with low head height or TORX<sup>®</sup> screws on request.

Load rate per roller: radial 50 % of given slider load rate 2RS (splashproof seal for CEX slider), 2Z (dust cover seal for CES slider)

Tab. 17

### **Fixing screws**

We recommend fixing screws according to ISO 7380 with low head height or TORX $^{\mbox{\tiny (B)}}$  screws (see fig. 23) on request.

Rail size	Screw type	d	D [mm]	L [mm]	K [mm]	S	Tightening torque [Nm]
20	M4 x 8	M4 x 0.7	8	8	2	T20	3
30	M5 x 10	M5 x 0.8	10	10	2	T25	9
45	M8 x 16	M8 x 1.25	16	16	3	T40	22

# **Technical instructions**

### Lubrication

All rollers of the X-Rail family are lubricated for life, although a thin film between the rolls and the raceways is recommended.

### T+U-System

### Solves axial deviations in parallelism

With the fixed/compensating bearing system made of T and U rails, Rollon offers a unique solution to the age-old problem of the parallel mounting of two linear bearings to surfaces that are misaligned and not parallel. This patented solution of a T and U rail allows the sliders to counteract the extreme loads caused by stresses occurring due to insufficient precision in the axial parallelism of the mounting surfaces. This misalignment compensation can drastically increase the service life in an application.

In a T+U-System, the slider in the T rail carries axial and radial loads and guides the movement of the U, which has lateral freedom.

U rails have flat parallel raceways that allow free lateral movement for the sliders. The maximum freedom a slider in the U rail can offer can be calculated using the values S<sub>1</sub> and S<sub>2</sub> (see pg. 17, fig. 25, tab. 19). With nominal value B<sub>nom</sub> as the starting point, S<sub>1</sub> indicates the maximum allowed movement into the rail, while S<sub>2</sub> represents the maximum offset towards the outside of the rail.

If the length of the guide rail is known, the maximum allowable angle deviation of the mounting surface (see pg. 17, fig. 26). In this case the slide in the U rail has the freedom to travel from the innermost position  $S_1$  to the outermost position  $S_2$ .

### Maximum offset

Slider type (Version 3 with solid body)	S <sub>1</sub> [mm]	S <sub>2</sub> [mm]	B <sub>min</sub> [mm]	B <sub>nom</sub> [mm]	B <sub>max</sub> [mm]
CEXU/CESU20-60	0.6	0.6	17.65	18.25	18.85
CEXU/CESU30-80	1	1	26.95	27.95	28.95
CEXU/CESU45-120	1.75	1.75	35.50	37.25	39
					Tab. 19

Guideline for the maximum angle deviation  $\boldsymbol{\alpha},\;$  achievable with the longest guide rail

$$\alpha = \arctan \frac{S^{\star}}{L} \qquad \qquad \begin{array}{c} S^{\star} = \text{sum of } S_{_1} \text{ and } S_{_2} \\ L = \text{length of the rail} \end{array}$$

Size	Rail length [mm]	Offset S* [mm]	Angle α [°]
20	3120	1.2	0.022
30	3120	2	0.037
45	3120	3.5	0.064
			Tab. 20

### Setting preload

Size	Tightening torque [Nm]
20	3
30	7
45	12
	Tab. 21

If the product is delivered with the sliders in the rails, the sliders are already preloaded. If delivered separately, or if the sliders need to be installed in another rail, the sliders must be readjusted. In this case, follow the instructions below:

- Wipe the raceways of any eventual dirt and debris.
- If necessary, remove existing wipers and insert the sliders into the rails.
  Slightly loosen the fixing screw of the center roller pin.
- Position the slider(s) at the ends of the rail.
- For the U rails there must be a thin support (e.g. set key) under the ends of the slider body to ensure the horizontal alignment of the slider in the flat raceways.
- The included special flat key is inserted from the side between the rail and the slider and plugged onto the hexagonal or square shaft of the eccentric pin to be adjusted (see fig. 28).

By turning the flat key clockwise, the eccentric roller is pressed against the upper raceway, thereby removing clearance and setting a correct preload. During this process, absence of play is desired; avoid a setting a preload that is so high that it generates higher friction and reduces service life.

- Hold the roller pin with the adjustment key in the desired position and carefully tighten the fixing screw. The exact tightening torque will be checked later.
- Move the slider in the rail and check the preload over the entire length of the rail. It should move easily and the slider should not have play at any location of the rail.
- Tighten the fixing screw with the specified tightening torque (see tab. 21), while holding the flat key and maintaining the angle position of the pin so as to not change the preload with the screw tightening.
- Now re-attach the existing wipers if desired.

### Telescopic drawer slide mounting

The telescopic drawer slide DRX / DRS must only be mounted horizontally. If the application requires vertical movement, please contact our technical customer service.

- The external loads should act on the radial centre, i.e. in the vertical cross-sectional axis on the movable rails (see pg. 7, fig.10).
- During installation care must be taken that the movable elements are assembled as in the figure; i.e. as the lower rail. The opposite upsidedown assembly negatively affects the function.
- The mounting structures must be rigid. All standard, available mounting holes must be used.
- When mounted as pairs, the mounting parallelism is very important and will effect slide quality.

Notes

# Ordering key

### Rail / slider system

TEX-	960	/1/	CEX20-60	-2RS		
				Roller seal	see pg. 6 Performance characteristics	
			Slider type	see pg. 9, tab. 6 and 7/ pg. 11, tab. 10		
		Number of sliders in one rail				
	Rail length i	length in mm see pg. 8, tab. 5 / pg.10, tab. 9				
Rail type	see pg. 8, tab. 4 / pg. 10, tab. 8					

Ordering example: TEX-00960/1/CEX20-060-2RS

Hole pitch: 40-11 x 80-40

Notes on ordering: The rail length codes are always 5 digits, the slider length codes are always 3 digits; use zeroes as a prefix when lengths are shorter

### Rail

TEX-	30-	960	
		Rail length in mm see pg. 8, tab. 5 / pg.10, tab. 9	
	Size se	ee pg. 8, tab. 4 / pg. 10, tab. 8	
Rail type	see pg. 8, tab. 4 / pg.10, tab. 8		

Ordering example: TEX-30-00960

Hole pattern: 40-11x 80-40

Notes on ordering: The rail length codes are always 5 digits; use zeroes as a prefix when lengths are shorter

### Slider

CES30-80	-2Z					
	Roller seal	see pg. 6 Performance characteristics				
Slider type	see pg. 9,	tab. 6 and 7/ pg. 11, tab. 10				

Ordering example: CES30-080-2Z

Notes on ordering: The slider length codes are always 3 digits; use zeroes as a prefix when lengths are shorter

### Telescopic

# Portfolio

### COMPACT RAIL

Rugged roller sliders with innovative self adjustment

### MONO RAIL

Profile guideways for highest degrees of precision

### CURVILINE Curvilinear rails for constant and variable radii

### MINIATURE MONO RAIL

Miniature format profile guideways with unique ball design

EASY RAIL Compact, versatile linear bearings

#### **TELESCOPIC RAIL**

Smooth-running telescopic linear bearing drawer slides with low deflection under heavy loads

### UNILINE

Steel-reinforced, belt-driven linear actuators with hardened steel linear bearings and precision radial ball bearing rollers

### LIGHT RAIL

Full and partial extension, lightweight drawer slides

# Fold out ordering key

To make this product catalog as simple as possible for you to use, we have included the following easy-to-read chart.

Your advantages:

- Description and ordering designations easy to read at one glance
- Simplified selection of the correct product
- Links to detailed descriptions in the catalog
