Safety precautions

Always read this section before starting use.

Refer to Intro 71 for general details on the cylinder, and to Intro 78 for details on the cylinder.

Small direct mounting cylinder MDC2 Series

Design & Selection

1. Common

CAUTION

■ MDC2 with reed switch cannot be installed on magnetic substance (iron plate, etc.).

■ MDC2 with proximity switch should be used at ambient temperature 40°C or less. Failure to observe this may cause switch detection defective.

2. Single acting MDC2-X, Y

CAUTION

■ Do not leave the single acting cylinder in the pressurized state. If left under elevated pressure, the piston rod may not return with the spring force when pressure is released.

3. Fine speed type MDC2-F

CAUTION

■ Use with oil-free specifications.

- Features may change if the device is lubricated.

■ Assemble the flow control valve near the cylinder.

- Adjustments become unstable if assembled away from the cylinder.
- Use the SC-M3/M5, SC3W, SCD-M3/M5, or SC3WU Series speed control valve.

■ Generally, the higher the air pressure, the smaller the load results in the more stable operation.

- Keep the load factor at 50% or less.

■ Stable speed control is achieved with a meter-out circuit.

- When driving the single rod cylinder at fine speed with the operation direction set to PUSH, popping-out may occur if operation is started when load resistance is small. As countermeasures, use a (b), (c), or (d) circuit. Note that the (d) circuit is the most stable.

PUSH: meter-out
PULL: meter-out

PUSH: meter-in
PULL: meter-in

PUSH: meter-in
PULL: meter-out

PUSH: meter-in/out
PULL: meter-out

① Speed adjustment method of PUSH operation of circuit:

1. Set the speed with the x flow control valve
2. Lower the flow rate with the y flow control valve until popping out no longer occurs
3. Reconfirm speed

(Note 1) When (b), (c) and (d) are compared, (d) circuit operation is most stable.
(Note 2) When installed vertically, the load will drop naturally if the meter-in circuit is used. Use the meter-out circuit in this case.

(Note 3) Connect the speed control valve in the parallel with the following circuit:

(Popping out phenomenon causes)

- The meter-out circuit slows the flow so fine speed is attained on the exhaust side, so both side reach the same pressure immediately after the valve is changed and the thrust of the piston pressurized area difference functions in the PUSH direction, causing popping out.

(Guide for popping out occurrence)

- Popping out occurs when the piston rod area x air pressure > load resistance.

■ Do not apply lateral load the cylinder.

Install the cylinder so the sliding guide is not twisted.

- Operation may become unstable due to fluctuations in load and resistance.
- Operation of a guide having a large difference in static and dynamic friction may become unstable.

■ Avoid use with vibration.

- The product would be adversely affected by vibration and operation may become unstable.

Installation & Adjustment

Note 1: X dimension shows projecting section of switch from the edge of groove. (A negative value shows hollowed dimensions.)
The upper row shows X dimension of axial lead wire type, while the lower row shows X dimension of radial lead wire type.
