

Note 1. Only for S2 side.

Note 2. Increase of rod seal and bearing increases resistance value. This results in the different minimum starting pressure.

Note 3. The installation position of value is different from standard.

Note 4. Minimum starting pressure on the side of S2 is higher than low friction standard type. Contact CKD for details.

Note 5. Resistance of bellows at stretch motion rises the value of minimum starting pressure. Contact CKD for details.

Note 6. Refer to the Clean Component System (Catalog No. CB-033SA) for details on new fine types P7 and P71.

Safety precautions

Always read this section before starting use.

Refer to Intro 71 for general notes of cylinders and Intro 78 for cylinder switches.

Medium bore size cylinder SCA2 Series

Design & Selection

1. Common

CAUTION

■ Install a flow control valve on the cylinder.

Install a flow control valve on the cylinder.

Use within the applicable piston speed range for each cylinder.

2. Position locking type SCA2-Q2

WARNING

■ If pressure is supplied to port (A) in the locked state with neither port pressurized, locks may not be releasable or may be released suddenly, causing the piston rod to pop out, which is extremely dangerous. When releasing locking mechanism, always supply pressure to port (B) and confirm the state if no load is applied to the locking mechanism before releasing the lock.

■ If lowering speed is to be increased with the quick exhaust valve, the cylinder may move out faster than the lock pin and prevent the locking pin from being released correctly.

Do not use a quick exhaust valve with the cylinder with position locking.

■ Do not use a 3-position valve.

Do not use this together with 3-position solenoid valve, especially with closed center metal seal type. This kind of use closes the pressure at the locking mechanism side, and is unable to lock the position. Even once locked, air leakage from a solenoid valve will enter to a cylinder and this may release locking.

CAUTION

■ Cylinder load factor must be 50% or less.

If the load factor is high, the lock may not be released or the lock section could be damaged.

■ If back pressure is applied to the locking mechanism, the lock may be released. Use the solenoid valve as a discrete unit, or use an independently exhausted manifold.

■ Do not operate cylinders synchronously.

Do not move more than one workpiece using more than two cylinders with position locking mechanism simultaneously. One of the cylinder's locks may not be released.

3. Low friction type SCA2-U

WARNING

■ Durability differs based on working conditions and model features.

This cylinder is the cylinder which has internal leakage.

Refer to the specification on page 516 for the internal leakage volume.

CAUTION

■ When a balancer, etc., is used, a flow control valve should not be installed if supply and exhaust efficiency are impaired. Use of circuits (a) to (c) below is recommended based on the application.

(a) Tension control (winder, etc.) (b) Balancer (finishing machine Z axis, etc.)

(c) Load control (grinding, etc.)

* Maximize piping volume to improve supply and exhaust.

■ Do not lubricate this product. Features will be adversely affected.

■ Poor air quality worsens features and adversely affects durability. Always Use clean air with the following piping.

■ Install the flow control valve near the cylinder.

If this is installed away from a cylinder, adjustment will be unstable.

- Generally, the speed is stable when the load factor is lower when air pressure is higher.

Keep the load factor at 50% or less.

4. Low hydraulic type SCA2-H

⚠ CAUTION

- Select low hydraulic cylinder combined with the converter unit.

Maximize operation by combining the low hydraulic cylinder and converter unit. Select an appropriate converter unit.

- Keep the low hydraulic cylinder's load to 50% or less of the logical output.

To attain constant speed operation and stopping precision performance similar to the hydraulic cylinder, the low hydraulic cylinder load must be 50% or less.

- Use petroleum-based turbine oil for working oil. Problems occur if noncombustible working oil is used.

The appropriate viscosity is 40 to 100 mm²/s at the working temperature. The temperature range is 15 to 35 °C at ISO VG32. When using in a range exceeding ISO VG32, use ISO VG46 (25 to 45 °C).

Turbine oil of ISO VG32

(Example) (Additive-free)

IDEMITSU	: Turbine oil P32
Nippon oil corp.	: Turbine oil 32
MARUZEN	: Turbine oil 32
MITSUBISHI	: MITSUBISHI turbine oil 32
(Additive)	
IDEMITSU	: Daphne turbine oil 32
Nippon oil corp.	: FBK turbine 32
MARUZEN	: Turbine super 32
MITSUBISHI	: Diamond turbine oil 32

5. Coolant proof type SCA2-G2/G3

⚠ CAUTION

- Do not apply the deviated load onto the piston rod. It could shorten scraper and bearing life.

- When using the G2 or G3 Series and the coolant or water does not splatter, the piston rod's lubrication could be spent and cause the life to shorten. Use the G or the G1 Series in this case.

6. Spatter proof adhesion prevention type SCA2-G4

⚠ WARNING

- The durability of this cylinder in an environment containing spatter is higher than the general cylinder, but durability may be shorter than the general cylinder when used in other environments.

Installation & Adjustment

1. Stroke adjustable type SCA2-R

⚠ CAUTION

- Accurately lock the stud bolt with a lock nut.
- Release air before adjusting stroke.
Do not tighten the stud bolt as shown in Fig 1.
Tighten the stud bolt as shown in Fig.2.
- Do not tighten the lock nut as shown in Fig.2.
Tighten the lock nut as shown in Fig. 1.
- If the above precautions are not observed, the seal washer may break after 1 or 2 adjustments.

- The seal washer is used as the stud bolt seal, and cannot withstand frequent adjustments.
- The cushion has no effect when adjusting the stroke.

2. Heat resistance type SCA2-T

⚠ CAUTION

- The magnet is not used.

3. Position locking type SCA2-Q2

⚠ CAUTION

- The lock functions at the stroke end. If the stopper is applied with an external stopper in the middle of the stroke, the lock may not function and result in dropping. Before setting the load, check that the locking mechanism functions correctly.

- Supply a pressure higher than the minimum working pressure to the port having the locking mechanism.

- If piping on the side with the lock is thin and long, or if the speed controller is separated from the cylinder port, exhaust may slow, taking time for the lock to function. This may also occur if the silencer on the valve's EXH port is clogged.

4. Low friction type SCA2-U

⚠ CAUTION

- Do not apply lateral load on cylinder.
Install sliding guide without twist and biting.
 - The presence of load or resistance variation may result in unstable operations.
 - Speed becomes unstable depending on the self-weight of the piston rod for long stroke. Install and use a guide.
 - Large differential between static friction and dynamic friction of guide results in unstable operation.
- Avoid use in the place subject to vibration.
 - The product will be adversely affected by vibration and operation will be unstable.

5. Low hydraulic type SCA2-H

- Do not use the push-in joint for low hydraulic cylinder piping.
Using a push-in joint for low hydraulic cylinder piping could result in oil leaks.
- Use copper or brass pipes when piping the low hydraulic cylinder.
As with the hydraulic cylinder, high surge pressure could be generated in low hydraulic cylinder piping due to working pressure. Use safe piping materials.
- Avoid use with single air or single hydraulic pressure.
Air could enter oil and cause malfunctions.

During Use & Maintenance

1. Position locking type SCA2-Q2

⚠ WARNING

- For safety purposes, prevent the load from dropping under its own weight during maintenance.
- When using the cylinder with air cushion, if the air cushion needle on the lock mechanism side is tightened too tight, the piston could bounce at the stroke end causing the sleeve and stopper piston to collide and damage the locking mechanism. If the air cushion needle is opened too far, the piston could spring back at the stroke end and cause similar damage. Adjust the air cushion needle so that the piston does not bounce.

Regularly (once/twice a year) check that the holding section is not damaged by this symptom.

⚠ CAUTION

- If the locking mechanism has been manually operated, check and then return it manually to the original position. Do not use a manual override except during adjustment, because this may be dangerous.
- Release the lock when installing or adjusting the cylinder.
The lock could be damaged if the cylinder is installed while the lock is applied.
- Use the flow control valve with meter-out control.
Locks may not be released during meter-in control.
- On the side of locking mechanism, the piston rod must reach the stroke limit.
If the cylinder's piston does not reach the stroke end, the lock may not be applied or may not be released.

■ Releasing the nonlocking manual override

The stopper pin moves and the lock is released when the hexagon socket head bolt is screwed into the stopper piston and the bolt is pulled up 4 mm with a force of 20 N or more. During no-load horizontal installation or when counter side port is pressurized. When the hand is released, if the stopper piston returns by the internal spring and enters the piston rod groove, the piston is locked.

■ Releasing the locking manual override

When the round nut is turned counterclockwise, the stopper pin moves and the lock is released. When the nut is turned clockwise to the lock position, the stopper piston returns. When it fits into the piston rod groove again, the piston is locked.

2. Low friction type SCA2-U

⚠ CAUTION

- Do not disassemble this product. The performance may be compromised.
This product cannot be purchased as a repair part.

3. Low hydraulic type SCA2-H

⚠ CAUTION

- Regularly exhaust air from the low hydraulic cylinder.
To keep air from accumulating there, use the air exhaust valve on piping exhaust before starting operation.
- If drainage enters working oil or if working oil becomes cloudy, degraded, or discolored, replace with new oil.
Use the same brand of oil for replacement.

Working fluid		Compressed air				
Max. working pressure	MPa	1.0				
Min. working pressure	MPa	0.1				
Withstanding pressure	MPa	1.6				
Ambient temperature	°C	-10 to 60 (no freezing)				
Port size		Rc1/4	Rc3/8		Rc1/2	
Stroke tolerance	mm	$^{+0.9}_0$ (Up to 360), $^{+1.4}_0$ (Up to 800)				
Working piston speed	mm/s	50 to 1000 (use within the allowable energy absorption.)				
Cushion		Air cushion				
Effective cushion length	mm	14.6	16.6	16.6	20.6	23.6
Adjustable stroke range	mm	25, 50, 75, 100				
Lubrication		Not required (when lubricating, use turbine oil Class 1 ISO VG32.)				
Allowable energy absorption	Cushioned	4.29	8.37	15.8	27.9	49.8
	No cushion	0.067	0.079	0.079	0.201	0.301
		If "No cushion" is selected, the large energy generated by the external load cannot be absorbed. So an external shock absorber should be used.

φ 100	SCA2-W-100K	

Note: Specify the kit No. when placing an order

Applications

Pressure setting is $P2 > P1$.

- First stage: push-out with pressurizing to port 4, apply pressure to port 1.
- Second stage : push-out with supplying pressurizing to port 1, supply pressure to port 3.

$P2 = P1$ is acceptable depending on a load direction.

When using a single acting cylinder with a load which drops by its own weight, for the drawing above, port 2 and 4 are used as bleed holes, while for the drawing below, port 2 and 3 are used as bleed holes.

Basically, piping ports (2) not requiring piping improve the cushion effect.

 Additional weight when strokes length 200mm ... $0.46 \times \frac{200}{100} = 0.92$ kg
 Weight for 2 switches ... $0.10 \times 2 = 0.20$ kg
 Product weight ... $1.48 + 0.92 + 0.20$ kg = 2.60 kg

Actuation		Double acting				
Working fluid		Compressed air				
Max. working pressure	MPa	0.7				
Min. working pressure	MPa	0.15				
Withstanding pressure	MPa	1.05				
Ambient temperature	°C	-5 to 50 (no freezing)				
Port size		Rc1/4	Rc3/8		Rc1/2	
Stroke tolerance	mm	$^{+0.9}_0$ (Up to 360) $^{+1.4}_0$ (Up to 800)				
Working piston speed <small>Note 1</small>	mm/s	50 to 500			50 to 450	
Cushion		Air cushion				
Effective cushion length	mm	14.6	16.6	16.6	20.6	23.6
Lubrication		Not required (when lubricating, use turbine oil Class 1 ISO VG32.)				
Allowable energy absorption J	Cushioned	4.29	8.37	15.8	27.9	49.8
	No cushion	0.067	0.079	0.079	0.201	0.301
If "No cushion" is selected, the large energy generated by the external load cannot be absorbed. So an external shock absorber should be used.						

Note 1: Use this within absorbed energy range.
To increase a piston speed of $\phi 100$ cylinder, using silencer (SLW-10A) as substitution of metering valve (SMW-10A) enables 500 mm/s.
